*wlalign* is a pure Python package that implements the graph-alignment routine based on the generalization of the Weisfeiler-Lehman algorithm proposed in [this paper](#).

The software provides the `wlalign` Python module, which includes all the **functions and tools that are necessary for computing network alignments and similarity**. In particular, specific functions are devoted to:

- Computing the **graph Jaccard index** of **similarity** between two weighted graphs.
- Solving the **graph alignment problem** with **WL-align**.

The package is [available at Pypi](#) and can be easily installed from the command line.

```
pip install wlalign
```

Talon is a free software released under [MIT license](#).

## **GETTING HELP**

The preferred way to get assistance in running code that uses WL-align is through the issue system of the [Gitlab repository](#) where the source code is available. Developers and maintainers frequently check newly opened issues and will be happy to help you.

## CONTRIBUTING GUIDELINES

The development happens in the `devel` branch of the [Gitlab repository](#), while the `master` is kept for the stable releases only. We will consider only merge requests towards the `devel` branch.

## HOW TO CITE

If you publish works using WL-align, please cite us as indicated here:

Matteo Frigo, Emilio Cruciani, David Coudert, Rachid Deriche, Emanuele Natale, Samuel Deslauriers-Gauthier; Network alignment and similarity reveal atlas-based topological differences in structural connectomes. *Network Neuroscience* 2021; doi: [https://doi.org/10.1162/netn\\_a\\_00199](https://doi.org/10.1162/netn_a_00199)

In section *How to cite WL-align* you will find the Bibtex entry.

### 3.1 Installation

WL-align runs only on Python 3. The installation has the following dependencies:

- Numpy
- Scipy

If you are an Anaconda user, you may want to create a dedicated `wlalign-env` environment and populate it with the right dependencies, then install WL-align.

```
conda env create -n wlalign-env -f environment.yml
pip install wlalign
```

Alternatively, you can install the dependencies and WL-align all via `pip`.

```
pip install numpy
pip install scipy

pip install wlalign
```

To install WL-align directly from the source, clone this repository and run the standard local setup commands.

```
git clone https://gitlab.inria.fr/cobcom/wlalign.git
cd wlalign
pip install -U .
```

### 3.1.1 Check installation

To check that WL-align has been properly installed, try to import the `wlalign` module into a Python session and print the version as follows. If no error is raised, the installation has been successful.

```
>>> import wlalign
>>> print(wlalign.__version__)
```

### 3.1.2 For developers

If you are thinking about developing your own fork of WL-align, you may want to use the latest version in the `devel` branch of the repository and install it in editable mode.

```
git clone https://gitlab.inria.fr/cobcom/wlalign.git
cd WL-align
git checkout devel
pip install -e .
```

### Tests

The package uses `unittest` as a testing suite. To run all the tests, execute the following command in the source's root directory.

```
python -m unittest -v
```

Test coverage can be checked with `coverage` as follows.

```
coverage run -m unittest
coverage report -m
```

### Documentation

The sources of the documentation are in the `doc` folder. The compilation requires the `sphinx` package and the theme to be installed.

```
pip install sphinx
pip install sphinx_rtd_theme
```

To compile the documentation, move to the `doc` folder and run `make <format>`, where the format can be `html`, `latex` or any other sphinx-compatible format. To get a local copy of the the `html` documentation, run the `make html` command.

```
cd doc
make clean # deletes results of previous compilations
make html
```

## 3.2 CLI: Command Line Interface

The user can align two graphs from the command line by providing their adjacency matrices in text form. The edge weights in each line must be separated by whitespaces.

```
wlalign --help
```

```
usage: wlalign [-h] [--first_aligned FIRST_ALIGNED] [--k INT] [--l INT]
              [--force] [-v]
              in_graph1 in_graph2 out_matching
```

This program uses WL-align to compute an alignment between two graphs having the same number of nodes. It takes as input their adjacency matrices and it returns a matching (a.k.a. alignment) between their nodes.

positional arguments:

<code>in_graph1</code>	Path to the first graph to be aligned
<code>in_graph2</code>	Path to the second graph to be aligned
<code>out_matching</code>	Path where the matching will be saved. The first element of each row is the index of the node in the first graph that is aligned with the node in the second graph indexed by the second element of the row

optional arguments:

<code>-h, --help</code>	show this help message and exit
<code>--first_aligned FIRST_ALIGNED</code>	The aligned version of the first input graph will be saved in the specified position (default: None)
<code>--k INT</code>	Width parameter (default: 2)
<code>--l INT</code>	Depth parameter (default: 2)
<code>--force</code>	Overwrite existing files (default: False)
<code>-v, --verbose</code>	Set verbose output (default: False)

## 3.3 Alignment module

`wlalign.alignment.apply_alignment(graph: numpy.ndarray, alignment: numpy.ndarray) → numpy.ndarray`  
 Permute the nodes of a graph according to a specified alignment.

**Parameters**

- **graph** –  
`np.ndarray` Graph that is being permuted.
- **alignment** –  
`np.ndarray` n-by-2 array with one row per node in the graph. The node indexed by the first element of each row is mapped to the second element in each row

**Returns**

`np.ndarray` The permuted graph.

`wlalign.alignment.length_wl_signature(k: int, l: int) → int`  
 Returns the length of the WL signature corresponding to the width and depth parameters given as input.

#### Parameters

- **k** –  
**int** Width of the breadth-first search.
- **l** –  
**int** Depth of the breadth-first search.

#### Returns

**int** Length of the WL align signature.

#### Raises

- **ValueError** – if  $k \leq 0$ .
- **ValueError** – if  $l \leq 0$ .

`wlalign.alignment.permutation_from_alignment(alignment: numpy.ndarray) → numpy.ndarray`  
Transform a matching into a permutation matrix.

#### Parameters **alignment** –

**np.ndarray** n-by-2 array with one row per node in the graph. The node indexed by the first element of each row is mapped to the second element in each row

#### Returns

**np.ndarray** Permutation matrix corresponding to the alignment

`wlalign.alignment.signature_wl(g: numpy.ndarray, k: int, l: int, node: int, volumes: Optional[list] = None) → numpy.ndarray`

Compute the WL-align signature of a node of a graph from its adjacency matrix.

#### Parameters

- **g** –  
**np.ndarray** Adjacency matrix of the graph.
- **k** –  
**int** Width parameter of the breadth-first search.
- **l** –  
**int** Depth parameter of the breadth-first search
- **node** –  
**int** Index of the node of which the signature must be computed.
- **volumes** –  
**Optional[list]** List containing the volume of each node. If not passed, it's computed on the fly from the adjacency matrix.

#### Returns

**np.ndarray** Signature of the node.

## References

Matteo Frigo, Emilio Cruciani, David Coudert, Rachid Deriche, Emanuele Natale, Samuel Deslauriers-Gauthier; Network alignment and similarity reveal atlas-based topological differences in structural connectomes. Network Neuroscience 2021; doi: [https://doi.org/10.1162/netn\\_a\\_00199](https://doi.org/10.1162/netn_a_00199)

`wlalign.alignment.wl_align(g1: numpy.ndarray, g2: numpy.ndarray, k: int, l: int) → numpy.ndarray`  
 Compute the WL alignment between two graphs as in Frigo et al., 2021.

### Parameters

- **g1** –  
**numpy.ndarray** Adjacency matrix of the first graph to align.
- **g2** –  
**numpy.ndarray** Adjacency matrix of the second graph to align.
- **k** –  
**int** Width parameter of the breadth-first search.
- **l** –  
**int** Depth parameter of the breadth-first search

### Returns

**numpy.ndarray** Matrix with two columns and one row per node. The first element of each row is the index of the node in the first graph that is aligned with the node in the second graph indexed by the second element of the row.

## 3.4 Similarity module

`wlalign.similarity.graph_jaccard_index(g1, g2)`  
 Compute the Graph Jaccard Index (GJI) between two graphs.

### Parameters

- **g1** –  
**numpy.ndarray** Adjacency matrix of the first graph.
- **g2** –  
**numpy.ndarray** Adjacency matrix of the second graph.

### Returns

**float** Value of the GJI between the two graphs. The value will be in the [0, 1] range.

## 3.5 Utils module

`wlalign.utils.check_can_write_file(fpath: str, force: bool = False) → None`

Check if a file can be written. The function checks if the file already exists, the user has the permission to write it, overwriting can be forced and, if the file does not exist, if the parent directory exists and is writable.

### Parameters

- **fpath** –  
**str** Path of the file to be checked.
- **force** –  
**bool** True if the file can be overwritten, False otherwise.

### Raises

- **FileExistsError** – if the file exists and can not be overwritten.
- **PermissionError** – if the file exists and the user does not have the permission to write it.
- **PermissionError** – if the file does not exist, the parent directory exists and the user does not have the permission to write a file in it.
- **FileNotFoundError** – if file does not exist and the parent directory does not exist.

`wlalign.utils.check_compatible_adj(g1: numpy.ndarray, g2: numpy.ndarray)`

Check if two graphs have the same number of nodes.

### Parameters

- **g1** –  
**np.ndarray** First graph to compare.
- **g2** –  
**np.ndarray** Second graph to compare.

**Raises ValueError** – if the two adjacency matrices do not have the same number of rows and columns.

`wlalign.utils.check_is_adj(g: numpy.ndarray)`

Check if a matrix is an adjacency matrix

### Parameters g –

**np.ndarray** Matrix to be checked.

### Raises

- **ValueError** – if the matrix is not 2-dimensional.
- **ValueError** – if the matrix is not square.

`wlalign.utils.check_is_alignment(alignment: numpy.ndarray, n: Optional[int] = None)`

Check if a numpy array is a valid alignment.

#### Parameters

- **alignment** –  
**np.ndarray** Alignment to be checked. Must be n-by-2 numpy array.
- **n** –  
**Optional[int]** Number of nodes expected to be found in the alignment.

#### Raises

- **ValueError** – if the alignment does not have 2 dimensions.
- **ValueError** – if the alignment does not have 2 columns.
- **ValueError** – if the alignment does not have n rows.
- **ValueError** – if the alignment is not a 1-1 correspondence.

`wlalign.utils.load_network(fpath: str, delimiter: str = ' ', skip: str = '#') → numpy.ndarray`  
Load a network from a text file with the adjacency matrix

#### Parameters

- **fpath** –  
**str** Path of the file where the adjacency matrix is saved.
- **delimiter** –  
**str** Character that separates two consecutive entries in a row. Default: whitespace.
- **skip** –  
**str** Lines that start with this character will be skipped.

#### Returns

**np.ndarray** The adjacency matrix.

`wlalign.utils.symmetrize_adj(g: numpy.ndarray) → numpy.ndarray`  
Transform a graph from directed to undirected by summing the weights in the two directions of each edge.

#### Parameters g –

**np.ndarray** Adjacency matrix of the graph to symmetrize.

#### Returns

**np.ndarray** Adjacency matrix of the symmetrized graph.

## 3.6 How to cite WL-align

If you use WL-align in your research, please cite the following article.

Matteo Frigo, Emilio Cruciani, David Coudert, Rachid Deriche, Emanuele Natale, Samuel Deslauriers-Gauthier; Network alignment and similarity reveal atlas-based topological differences in structural connectomes. Network Neuroscience 2021; DOI: [10.1162/netn\\_a\\_00199](https://doi.org/10.1162/netn_a_00199)

```
